```

Q1. How many genes are in this dataset?

There are 38694 genes in this data set.

Q2. How many 'control' cell lines do we have?

There are 4 control cell lines.

#4. Toy differential gene expression

Extract and summarize the control samples

```
control <- metadata[metadata[,"dex"]=="control",]
control.counts <- counts[ ,control$id]
control.mean <- rowSums( control.counts )/4
head(control.mean)
```

```
ENSG000000000003 ENSG000000000005 ENSG000000000419 ENSG000000000457 ENSG000000000460
      900.75           0.00          520.50          339.75          97.25
ENSG0000000000938
      0.75
```

Extract and summarize the treated (i.e. drug) samples

Q4. Follow the same procedure for the treated samples (i.e. calculate the mean per gene across drug treated samples and assign to a labeled vector called `treated.mean`)

```
treated <- metadata[metadata[, "dex"]=="treated",]  
treated.counts <- counts[,treated$id]  
treated.mean <- rowMeans(treated.counts)
```

Store these results together in a new data frame called `meancounts`

```
meancounts <- data.frame(control.mean, treated.mean)
```

Lets make a plot to explore the results a little

```
plot(meancounts[,1], meancounts[,2], xlab="Control", ylab="Treated")
```

Q5 (b). You could also use the `ggplot2` package to make this figure producing the plot below. What `geom_?()` function would you use for this plot?

`geom_point`

```
library(ggplot2)

ggplot(meancounts) +
  aes(control.mean, treated.mean) +
  geom_point()
```

We will make a log-log plot to draw out this skewed data and see what is going on.

Q6. Try plotting both axes on a log scale. What is the argument to `plot()` that allows you to do this?

log

```
plot(meancounts[,1], meancounts[,2], log="xy",
     xlab="Log Control Counts",
     ylab="Log of Treated Counts")
```

Warning in `xy.coords(x, y, xlabel, ylabel, log)`: 15032 x values ≤ 0 omitted from logarithmic plot

Warning in `xy.coords(x, y, xlabel, ylabel, log)`: 15281 y values ≤ 0 omitted from logarithmic plot

We often log2 transformations when dealing with this sort of data.

```
log2(20/20)
```

```
[1] 0
```

```
log2(40/20)
```

```
[1] 1
```

```
log2(20/40)
```

```
[1] -1
```

```
meancounts$log2fc <- log2(meancounts[, "treated.mean"] / meancounts[, "control.mean"])  
head(meancounts)
```

	control.mean	treated.mean	log2fc
ENSG000000000003	900.75	658.00	-0.45303916
ENSG000000000005	0.00	0.00	NaN
ENSG000000000419	520.50	546.00	0.06900279
ENSG000000000457	339.75	316.50	-0.10226805
ENSG000000000460	97.25	78.75	-0.30441833
ENSG000000000938	0.75	0.00	-Inf

```
zero.vals <- which(meancounts[,1:2]==0, arr.ind=TRUE)

to.rm <- unique(zero.vals[,1])
mycounts <- meancounts[-to.rm,]
head(mycounts)
```

	control.mean	treated.mean	log2fc
ENSG000000000003	900.75	658.00	-0.45303916
ENSG000000000419	520.50	546.00	0.06900279
ENSG000000000457	339.75	316.50	-0.10226805
ENSG000000000460	97.25	78.75	-0.30441833
ENSG000000000971	5219.00	6687.50	0.35769358
ENSG000000001036	2327.00	1785.75	-0.38194109

Q7. What is the purpose of the arr.ind argument in the which() function call above? Why would we then take the first column of the output and need to call the unique() function?

It will return both the rows and columns where there are TRUE values. Unique() will make sure they are not present twice.

```
up.ind <- mycounts$log2fc > 2
down.ind <- mycounts$log2fc < (-2)
```

Q8. Using the up.ind vector above can you determine how many up regulated genes we have at the greater than 2 fc level?

```
sum(up.ind)
```

```
[1] 250
```

There are 250 up regulated genes.

Q9. Using the `down.ind` vector above can you determine how many down regulated genes we have at the greater than 2 fc level?

```
sum(down.ind)
```

```
[1] 367
```

There are 367 down regulated genes.

Q10. Do you trust these results? Why or why not?

No, as we haven't made sure they are significant we will need to use DESeq2 to make sure of this.

Setting up for DESeq

```
library(DESeq2)
citation("DESeq2")
```

To cite package 'DESeq2' in publications use:

library("AnnotationDbi")
```

Warning: package 'AnnotationDbi' was built under R version 4.3.2

```
library("org.Hs.eg.db")
```

```
columns(org.Hs.eg.db)
```

[1]	"ACCNUM"	"ALIAS"	"ENSEMBL"	"ENSEMBLPROT"	"ENSEMBLTRANS"
[6]	"ENTREZID"	"ENZYME"	"EVIDENCE"	"EVIDENCEALL"	"GENENAME"
[11]	"GENETYPE"	"GO"	"GOALL"	"IPI"	"MAP"
[16]	"OMIM"	"ONTOLOGY"	"ONTOLOGYALL"	"PATH"	"PFAM"
[21]	"PMID"	"PROSITE"	"REFSEQ"	"SYMBOL"	"UCSCKG"
[26]	"UNIPROT"				

The main function we will use here is called `mapIds()`

Our current IDs are here:

```
#mapIds()
head(row.names(res))
```

```
[1] "ENSG000000000003" "ENSG000000000005" "ENSG000000000419" "ENSG000000000457"
[5] "ENSG000000000460" "ENSG000000000938"
```

These are in ENSEMBLE format. I want “SYMBOL” ids:

```
res$symbol <-mapIds(org.Hs.eg.db,
                    keys = row.names(res),
                    keytype="ENSEMBL",      #Our genenames
                    column = "SYMBOL",      #Format our our new genenames
                    multiVals = "first")    #New format we want to add
```

'select()' returned 1:many mapping between keys and columns

```
head(res)
```

log2 fold change (MLE): dex treated vs control

Wald test p-value: dex treated vs control

DataFrame with 6 rows and 7 columns

	baseMean	log2FoldChange	lfcSE	stat	pvalue
	<numeric>	<numeric>	<numeric>	<numeric>	<numeric>

What we need for `gage()` is our genes in ENTREZ id format with a measure of their importance.

It wants a vector of e.g. fold-changes.

```
foldchanges = res$log2FoldChange
```

```
names(foldchanges) = res$entrez  
head(foldchanges)
```

```
      7105      64102      8813      57147      55732      2268  
-0.35070302      NA  0.20610777  0.02452695 -0.14714205 -1.73228897
```

Now we can run `gage()` with this input vector and the genset we want to examine for overlap/enrichment...

```
# Get the results  
keggres = gage(foldchanges, gsets=kegg.sets.hs)
```

Look at the results

```
attributes(keggres)
```

```
$names
```

```
[1] "greater" "less" "stats"
```

```
head(keggres$less, 3)
```

		p.geomean	stat.mean	p.val
hsa05332	Graft-versus-host disease	0.0004250461	-3.473346	0.0004250461
hsa04940	Type I diabetes mellitus	0.0017820293	-3.002352	0.0017820293
hsa05310	Asthma	0.0020045888	-3.009050	0.0020045888
		q.val	set.size	exp1
hsa05332	Graft-versus-host disease	0.09053483	40	0.0004250461
hsa04940	Type I diabetes mellitus	0.14232581	42	0.0017820293
hsa05310	Asthma	0.14232581	29	0.0020045888

We can view these pathways with our geneset genes highlighted using the `pathview()` function. E.g. for “Asthma” I will use the pathway.id hsa05310 as seen above.

```
pathview(gene.data = foldchanges, pathway.id = "hsa05310")
```

'select()' returned 1:1 mapping between keys and columns
